Key flight 2, stock PX4's worst case: motor-fault mission, seed 19 (wave O); old MRAC falls at the motor fault

Same seed for every arm (same wind, vehicle and events). Grey bands: goto transits, where the error is the distance still to fly, not tracking error; they are left out of (b) and (c). Vertical lines: mission events as applied in the sim. The plot ends at the land command.
